

WHAT-IF SCENARIO ANALYSIS

Valencia Operations · Three-case · 2026-07-23

CASES

Driver	Base	Pessimistic	Realistic	Optimistic
Revenue	12.00%	9.00%	12.00%	15.00%
COGS	41.80%	44.80%	41.80%	38.80%

How the cases were set: a chosen band of 0.03 either side of the base plan. The realistic case is the base plan.

PROFIT AND LOSS ACROSS CASES

Line	Base	Pessimistic	Realistic	Optimistic
Revenue	8,490,872	8,263,438	8,490,872	8,718,306
COGS	3,549,185	3,702,020	3,549,185	3,382,703
Gross Profit	4,941,688	4,561,418	4,941,688	5,335,603
Personnel Cost	1,732,250	1,732,250	1,732,250	1,732,250
Marketing Spend	534,000	534,000	534,000	534,000
IT Infrastructure	270,000	270,000	270,000	270,000
R&D Expense	1,863,247	1,863,247	1,863,247	1,863,247
Total OpEx	4,399,497	4,399,497	4,399,497	4,399,497
Operating Profit (EBIT)	542,191	161,921	542,191	936,106
EBIT versus base		-380,270	+0	+393,916

ANALYSIS

Key takeaways

- EBIT ranges from 161,921 in the pessimistic case to 936,106 in the optimistic case, against a base of 542,191.
- Downside -380,270, upside +393,916, a total spread of 774,186.
- The downside and upside are broadly symmetric.
- Drivers flexed together: Revenue, COGS.

The three-case scenario analysis produces an EBIT range running from 161,921 in the pessimistic case to 936,106 in the optimistic case, with the realistic case landing at 542,191, which is identical to the base plan by design since the realistic case is the base plan. That 774,185 spread represents the planning envelope the finance team should hold in mind. Notably, the upside of roughly 393,915 above base is considerably larger than the downside of roughly 380,270 below base, meaning the distribution of outcomes is slightly skewed to the upside, though the two sides are broadly comparable. This relative symmetry reflects the structured way the cases were built: each driver was moved exactly 0.03 either side of its base value,

producing a disciplined and even-handed band rather than an asymmetric stress test.

Two drivers were flexed simultaneously to generate these cases. Revenue growth moves from 9.00 percent in the pessimistic case up through 12.00 percent at base to 15.00 percent in the optimistic case, while COGS as a percent of revenue moves in the opposite direction, falling from 44.80 percent in the pessimistic case down through 41.80 percent at base to 38.80 percent in the optimistic case. Because a higher COGS ratio compounds the damage from slower revenue in the bad case, and a lower COGS ratio amplifies the benefit of faster revenue in the good case, the two drivers reinforce each other and are responsible for the wide EBIT swing seen here. It is important to note what this model does not do: drivers not selected, including marketing spend and customer counts, are held constant across all three cases, and this model does not establish any link between marketing activity or customer volumes and revenue. The revenue and COGS assumptions are the sole source of variation in this analysis.
